

Master Build Prompt — Hometown Hub

Digital Community Platform

Master Build Prompt — Hometown Hub (Digital Community Platform)

Use this prompt with an AI coding assistant (Claude Code, Cursor, etc.) to build the application end-to-end. It references the five companion documents that must sit in the project root: `architecture.md`, `rules.md`, `phases.doc.md`, `design.md`, `memory.md`.

1. Project Summary

Build **Hometown Hub**, a hyperlocal, web-based community platform that lets people from the same city or village connect, share updates, organize events, and preserve local culture — a focused alternative to broad social networks and scattered WhatsApp groups (closest reference: Nextdoor).

2. Instruction to the AI Assistant

You are acting as a full-stack engineering partner. Before writing any code:

1. Read ``architecture.md`` to understand the system design and folder structure.
2. Read ``rules.md`` and follow it strictly — it defines approved tech, banned patterns, and the boundaries of what you may decide on your own.
3. Read ``phases.doc.md`` and implement the product **one phase at a time**, in order. Do not start Phase 2 work until Phase 1 is functionally complete.
4. Read ``design.md`` before building any UI and apply its colors, type scale, and UX principles consistently.
5. After every meaningful step (feature completed, decision made, bug fixed), update ``memory.md`` so the project has continuity across sessions.
6. Ask for clarification only when a requirement is genuinely ambiguous or missing — otherwise make a reasonable choice, note it in ``memory.md``, and keep moving.

3. Problem Statement

- No dedicated platform exists for hometown/village-level community networking.

- Communication is scattered across WhatsApp groups with no structure.
- There's no central place for local announcements, events, or news.
- People lose touch with their hometown community after moving away.

4. Objectives

Primary

- Let people from the same city/village connect digitally.
- Provide one place for community updates and discussion.
- Support event creation and organization.
- Strengthen local participation and bonding.

Secondary

- Preserve local culture and traditions.
- Enable community-led initiatives and support groups.
- Surface local news and alerts.
- Encourage cross-community collaboration.

5. Scope

In scope: responsive web app, community creation/membership, posts & discussions, event creation/management.

Out of scope (Phase 1): native mobile apps, paid ads, advanced AI moderation, government/emergency alert integrations.

6. User Roles & Core Features

Role	Key capabilities
User	register/login, join or create a community, post/comment/like/share, create & join events, receive notifications
Community Admin/Moderator	approve/reject members, set community rules, moderate posts/comments, pin announcements, manage events
Platform Admin	approve new communities, manage users/moderators, monitor activity, handle abuse reports, manage analytics

7. Non-Functional Requirements

- Page loads under 3 seconds; supports concurrent usage.
- Secure authentication and data privacy by default.
- Mobile-first, simple, intuitive UI.
- Architecture must scale to many cities/villages.

8. Tech Stack

- **Frontend:** React.js / Next.js, HTML5/CSS3/JS, Tailwind CSS (or Bootstrap)
- **Backend:** Node.js + Express.js
- **Database:** MongoDB or PostgreSQL
- **API style:** REST
- **Deployment:** Vercel / Netlify (frontend), AWS/Render (backend)

9. Core Data Entities

Users, Communities, Posts, Comments, Events, Moderators, Notifications.

10. Deliverables

- Functional web application (all 6 phases from phases . doc . md)
- Admin dashboard
- Community onboarding module
- PRD & technical documentation (this file set)
- Deployment-ready build

11. Success Metrics (KPIs)

Registered users, active communities, daily active users, post/engagement rate, event participation rate, community growth rate.

12. How to Use This Prompt

Paste this entire file as the system/context prompt for your coding assistant at the start of every session, alongside the current contents of memory . md so it knows exactly where the project left off.
